

Lab 1 Instructions – Intro to JavaScript

CS133JS, Beginning Programming: JavaScript

Overview

The objective of this lab is to give you practice working with:

- Visual Studio Code
- The browser console
- HTML script elements
- The *document.write* function
- JavaScript variables
- The assignment operator

Part 1

Run all the code examples in the first half of [Up and Going, Chapter 1](#)—every example starting with the [Try It Yourself](#) section, up through the end of the section [Variables](#) section. The “Try It Yourself” section explains how to run the code examples. Don’t clear the console after executing each example.

When you are done, copy the contents of the console by right-clicking on one of the lines of code, clicking on “select all” and then copying everything to the clipboard. Next, paste the code into a Word document with your name, lab number and date at the top.

Part 2 – Assignment Group A

Create a simple web page that consists of a single .html file with a script element in it. The web page should look similar to the example below when viewed in a browser:

Requirements:

- Everything you see on the page should be generated by *document.write* statements.
- You should use two variables:
 - One to hold the name of your hero—use this in both the *alt* attribute for the image and in the caption at the bottom
 - One to hold the URL of the image—use this for the *img src* attribute.
- The image should have alt text with the name of your hero.
- Choose your own hero.
- Put your name and the date in comments in the head element of the page.

Tips

- Write the plain HTML code for your web page before putting parts of it into `document.write` statements. This way you'll know you're at least doing the HTML code right.
- For examples of using both single and double quotation marks in strings, look at this [W3Schools tutorial on strings](#).
- Test the strings you are passing to `document.write` in the console by passing them to `console.log` so you can see if all the pieces of the string got put together correctly.
- To refresh your memory on how the `alt` attribute works, look at this [W3Schools tutorial on alt](#).

Submitting your lab work on Moodle

Beta Version

Post the following in the *Lab Beta forum*:

1. The web page you created for part 2.
2. A code review of your lab partner's web page for part 2.
(Review one of your lab partners' web pages using the Code Review Form provided.)

Code Review

1. Submit a copy of the code review above to the *Lab Code Review assignment*.

Production Version

Based on the review and helpful advice from your lab partner, you may revise your web page. On the code review from your lab partner, complete the "Production" column to show what you revised. Upload the following to the *Lab Production Version* assignment:

1. The Word document containing all the code you ran for part 1.
2. The HTML file you created for part 2.
3. The image file that is used in your page (unless you linked an image that's online).
4. The code review from your lab partner with the "Prod" column filled in by you.
